1. March 2013

Outline

- ▶ Background
- ▶ MPLS Fundamentals and Terminology
- ▶ Control and Forwarding Plane
- ▶ Generalized MPLS
- ▶ GMPLS Recovery techniques
- ▶ Summary
- ▶ Resources

Background

- ▶ What is MPLS?
 - ▶ Mechanism that directs data from one network node to the next based on on path labels rather than network addresses.
 - ▶ with such mechanism, we avoid lookups in a routing table
 - ▶ MPLS switches packets (IP packets) instead of routing packets to transport the data
- ▶ Why MPLS?
 - ▶ Provide a highly scalable mechanism that was topology driven rather than flow driven
 - ▶ Load balance traffic to utilize network bandwidth efficiently
 - ▶ Allow core routers/networking devices to switch packets based on a simplified header
 - ▶ Remove the complexity and overhead of network managements (Assemble and reassemble IP packets)

MPLS was conceived, why?

- ▶ The shortest path routing protocols like IS-IS and OSPF
 - ▶ Did not take capacity characteristics into account while making the routing decisions
 - ▶ The outcome is, segmentation over the network which leads to congestion, while others remain under-utilized.
- ▶ MPLS reduces the complexity and redundancies by adding new network functionalities.

MPLS Fundamentals and Terminology

- ▶ What is GMPLS?
 - ▶ a protocol suite extending MPLS to manage further classes of interfaces and switching technologies other than packet interfaces and switching, such as time division multiplex, layer-2 switch, wavelength switch and fiber-switch.
- ▶ How does it work?
 - ▶

GMPLS: Hierarchical LSP

Summary

- ▶ MPLS
- ▶ GMPLS
